Sammenhørende med Assessment of motor and process skills: Volume 2: User Manual

The Assessment of Motor and Process Skills (AMPS) is an innovative observational evaluation designed to be used by occupational therapists to evaluate the quality of a person's performance of activities of daily living (ADL) in natural, task-relevant environments.

To examine if there was an overall difference in AMPS motor ability measures and AMPS process ability measures among the conditions, data were analysed using a one-way repeated measures ANOVA. To locate where the differences lay paired samples t- tests were performed. Results indicated occupational performance in ADL improved significantly, in both motor skill ability and process skill ability when environmental set-up was compared to other conditions. Neither labelling the environment nor practice alone appeared to improve occupational performance for the group. This finding suggests that people diagnosed with mild to moderate dementia may benefit from specific interventions that involve setting up their task environment to improve occupational performance in ADL. This means that environmental set-up might be a valuable intervention strategy for occupational therapy practice that can be used to optimise occupational performance.

This Encyclopedia goes beyond other references in the field to offer concise and comprehensive coverage of assessment, treatment and rehabilitation in a single source, with more than fifteen hundred entries with linked cross-references and suggested readings.

'Neurorehabilitation in Parkinson's Disease' serves as a reference for the treatment of patients with Parkinson's disease. In addition to providing treatment models for physical therapy, occupational therapy, & speech-language pathology, the text covers topics such as review of pathophysiology, & symptomatology.
