This collection of essays highlights, in a new, critical fashion, some of the classic questions in life science. These include "what is life?"; "what is death?"; "what is consciousness?"; "why is life cellular?"; and "why are enzymes macromolecules?". It also explores whether evolution is pre-determined, whether science and spirituality can harmonize with each other, whether artificial intelligence is at odds with the human spirit, and whether, and to what extent, we are genetically determined. In this text, some of the main conceptual tools used to tackle life's many aspects are necessarily reviewed, such as the systems view of life, the notion of contingency, and the concept of autopoiesis. Each of the three chapters of the book contains a number of short science fiction stories which discuss aspects of the present-day development of artificial intelligence.

Explores how the concept of 'compound individuality' brought together life scientists working in pre-Darwinian London. This book states that scientists conducting research in comparative anatomy, physiology, cellular microscopy, embryology and the neurosciences repeatedly stated that plants and animals were compounds of smaller independent units.

Medical articles are one of the main vehicles of knowledge translation and evidence communication in the health sciences. Their correct structure and style alone are no longer enough to convey a clear understanding of the intended message. Readers must be able to understand the very essence of the article message. That is the purpose of this book. Writing, Reading, and Understanding in Modern Health Sciences: Medical Articles and Other Forms of Communication will help the authors of medical articles communicate more effectively in today's practice and health research environment. It explores the most effective practices for communicating using three main medical literature formats: through scientific articles, articles where the subject is not based on the practice of the scientific method, and business reports. Describing how to think beyond the prevailing IMRAD article format, this book focuses on the nature, content, domains of thought, and meanings of medical articles. The ideas and underlying propositions in this book are complementary to specific requirements appropriate for each type of medical journal. After reading this book you will better understand: How to write what is considered the most important type of medical article, the research-based medical article How to write an evidence-based argumentative medical article The challenges of clinical case reporting The general framework of medical and research ethics Classification of medical articles and their underlying studies from the causal standpoint Supplying you with the understanding required to write more effective medical articles, the book includes details about essay-type articles, research-based articles, thesis as introduction sections, definitions as part of the material and methods sections, modern argumentation and critical thinking underlying results and their discussion and conclusions about them. It also examines qualitative research and case study methodologies from other domains. A must-read for all writers, readers, and users of medical articles, this book supplies the tools you need to write compelling medical reports that can help to improve the practice, research, and quality of healthcare at all levels.

Reproduction of the original: Life and Letters of Thomas Henry Huxley by Leonard Huxley

The second half of the twentieth century brought extraordinary transformations in knowledge and practice of the life sciences. In an era of decolonization, mass social welfare policies, and the formation of new international institutions such as UNESCO and the WHO, monumental advances were made in both theoretical and practical applications of the life sciences, including the discovery of life's molecular processes and substantive improvements in global public health and medicine. Combining perspectives from the history of science and world history, this volume examines the impact of major world-historical processes of the postwar period on the evolution of the life sciences. Contributors consider the long-term evolution of scientific practice, research, and innovation across a range of fields and subfields in the life sciences, and in the context of Cold War anxieties and ambitions. Together, they examine how the formation of international organizations and global research programs allowed for transnational exchange and cooperation, but in a period rife with competition and nationalist interests, which influenced dramatic changes in the field as the postcolonial world order unfolded.

This volume is a collection of essays on different subjects written by the author. The initial section of three essays includes writings on global warming, the understanding of the scientific method and what pseudoscience is, and a discussion of hydrogen as a potential power source. The second section includes a discussion of the science underlying the problem of obesity and two previously published reviews of two important hormonal systems. The third essay of this section is a personal view of evolution and man's place in nature. The final section of the book deals with various thoughts on government. An essay on the changing interpretation of our Constitution since its creation in 1787, errors since the Second World War of our intelligence community, and a critique over our invasion of Iraq and its sequel. The final chapter is from a book in preparation on the Radicals Behind the American Revolution. This initial chapter describes the development and uniqueness of the American Colonies before the Revolution. It is hoped that the reader will find at least some of the writing interesting and educational.
