Visitor pattern allows us to create a separate visitor concrete class for each type of operation and to separate this operation implementation from the objects structure.

The object structure is not likely to be changed but is very probable to have new operations which have to be added.

Visitor design pattern is one of the behavioral design patterns. It is used when we have to perform an operation on a group of similar kind of Objects. With the help of visitor pattern, we can move the operational logic from the objects to another class. The visitor pattern consists of two parts:
